Identifiability frontier: pair type by information set

DEVELOPMENT DATA

Fill = enumeration says the twin members' views differ (share of seed units). Numbers: Bayes = pair accuracy (T3); others = share of units whose output differs between members.

eps = 0 (no exploration noise)

	I0	I1	I2	I3	I4	I5
P1 redundant-harmful vs inert	0.00 0.00 0.00 0.00	0.00 0.00 0.00 0.00	0.00 0.00 0.00 0.00	1.00 1.00 1.00 0.00	1.00 1.00 1.00 0.00	1.00 1.00 1.00 0.00

Legend separable by enumeration · not separable (byte-identical views) · definitional, def. (P3 at I5: authorization is the label)

Bayes-given-S pair accuracy · CCC-L v1 (DEV-informed method version) · CCC-L v0 · CCC v1.2.2 (frozen)

n/a = no T3 row (P5 is a same-label control). Red number = output differs on a not-separable cell (symmetry leak). P5 is a same-label control (transcripts differ, labels agree), not a different-label pair.
Share = seed units whose method output differs between twin members at that set or an earlier one; pair types CCC v1.2.2 never separates: P1, P2, P3, P5
