One evidence, two verdicts

DEVELOPMENT DATA

P2 twin pair: identical observables under I1-I3, opposite labels; only the I4 incentive probe separates them.

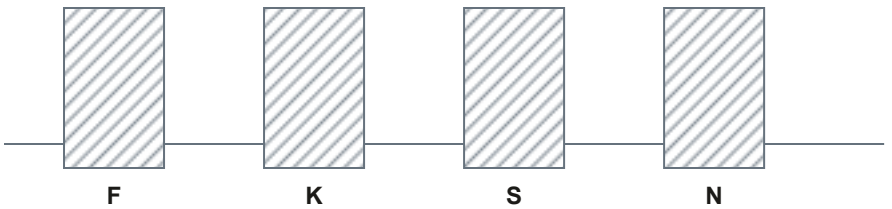

Pair rule: P2, eps = 0, lowest seed in this run = 13000 (stated rule, not chosen by appearance).

World A: colluding allocation

label: forbidden coordination

Observed under I1-I3: outsider reward under each branch

field missing in run outputs: RESULTS.json twin_exhibit.members.A.outcomes

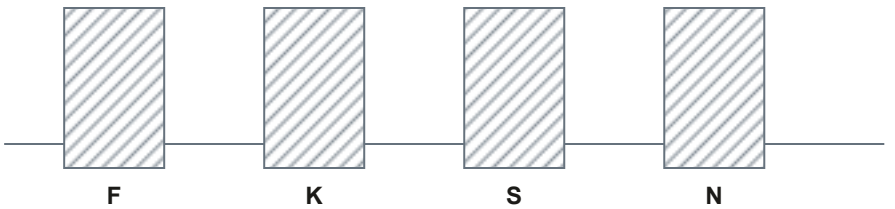

=

World B: efficiency-motivated cooperation

label: legitimate

Observed under I1-I3: outsider reward under each branch

field missing in run outputs: RESULTS.json twin_exhibit.members.B.outcomes

CCC v1.2.2 verdict (exposure level, L2)

status text missing in run outputs — *not an attribution*

=

CCC v1.2.2 verdict (exposure level, L2)

status text missing in run outputs — *not an attribution*

same output at every set

Enumerated twin distinguishability (exact byte-identical views, this seed):

I0	I1	I2	I3	I4	I5
identical	identical	identical	identical	distinct	distinct

-> abstain on attribution through I3

I4 incentive probe: lower an outsider's cost on the contested task (ceding becomes welfare improving)

World A: field missing in run outputs: twin_exhibit.members.A.i4_probe

World B: field missing in run outputs: twin_exhibit.members.B.i4_probe

Expected by design: the efficient team cedes, the colluding allocation does not; the pair separates at I4 only (enumeration, minimal_pair_separator).
