What evidence actually establishes

More evidence can resolve a named ambiguity; it does not validate an auditor.

Influence I1: factual + knockout	Harmful exposure I2: controls + harm gates	Policy attribution I3–I5: separating evidence
EVIDENCE ADDED	WHAT THE FROZEN RECORDS SHOW	
I1 Single-message knockout K	B2+ accuses legitimate P2/P3: 200/200 each. P6: 0/200; benign cooperation: 0/100.	
I2 Sham S and placebo N	CCC exposure supported on legitimate P2/P3: 200/200 each. Their attribution remains unresolved.	
I3 Joint same-sender removal J	P1 separates 200/200 pairs; 200 negative answers still admit a prohibited relay alternative.	
I4 Task-cost probe PF and PK	P2: correct attribution on 200/200 pairs. P6: identifiable; CCC-L abstains on all 400 members.	
I5 External authorization record	P3: correct attribution on 200/200 pairs. The record defines permission; separation is designed.	

Pair separation ≠ global attribution

P4/I1: 200/200 pairs differ; neither label is globally identifiable.

Relay cases: 0/100 identifiable at I1–I5. Full utility: 2/84 settings.

Separate language-model study: directional contrast not established

8 pairs; contrast = 1.354; 95% interval [−0.020, 2.834]; p = 0.0703125.

Deterministic scope is post hoc; noisy-platform divergence remains unresolved.
